

## How to prepare the swipe card project?

1. The project should be sent in programs such as: Corel (\*.cdr) up to and including version X3, Adobe (\*.ai, \*.eps) up to and including version 10, PDF format (\*.pdf) and attach a preview in JPG, GIF, BMP.
2. Design size should be 90mm x 58mm. This is the size of the card increased by 2mm (technological drops). After cutting, the card dimensions will be 86 x 54mm.
3. The distance of fixed elements (i.e. graphics, logos, captions) from the edge of the card (86 x 54mm) is min. 3mm.
4. Please use CMYK colours.
5. No rounded corners.
6. Optimal resolution of 300dpi.
7. Fonts in the project changed to curves.
8. 150 ruling.
9. The magnetic strip will be 13mm high and it is positioned 6mm from the edge of the design.

10. The barcode takes up the size depending on the code format and the number of characters. For example:
  - the EAN13 code will fit in an area of 32 x 16mm

- EAN8 code on a field of 24 x 14mm
- Code 128 code with a length of 6 characters in a 30 x 16mm field
- Code 39 code 8 characters long in the 42 x 18mm field

**CAUTION!**

Please remember that the colour of the card will be different from printouts seen on the computer to actual prints. This is due to the different calibrations of the devices and the printing parameters (colour of the substrate, paints used, laminate). Reliable programmes to check the colours of the prepared material are Cromalin or Matchprint.
